

CONSULTATION FRAMEWORK

— Knock on Door —

Pressure Test: 2 mins

“Before we get started today, I just need to conduct a brief pressure test on your water.”

- Some houses we test are above the legal limit (500kPa)
 - Homes that exceed this limit would not be eligible for any water-related insurance claim (not just filter-related claims)
-

Introduction: 5 mins

- Run the tap for 2+ minutes (use a timer)
 - Running the tap ensures accurate test results
 - Letting the water run draws directly from the mains out front
 - Since chlorine is a gas, it can separate from water. If the tap isn't run, test results may read either too high or too low
-

Hand Out Brochures

- Pass a brochure to each member attending the consultation

“What's the main reason for your inquiry with us today? Any specific concerns you have?”

- Is the customer currently using a filter? Buying bottled water? Drinking straight from the tap? Or boiling water?
 - If buying bottled — how much are they spending weekly/monthly?
 - If using a filter — what type?
-

“So, we've got a few different systems available — two main options. Our most popular product, which around 9 out of 10 customers choose, is the **Whole Home Filtration System**. It filters every outlet in your home — meaning you're not just drinking clean water, but also cooking with it, cleaning with it, and most importantly, bathing in it.”

- Many of our clients suffer from issues like dry skin, itchy skin, or hair loss
- By removing harsh chemicals from their water, many experience significant relief from these concerns

“We also offer what we call a **Reverse Osmosis System**, or RO. This one is strictly for drinking and cooking. Some customers choose to install this alongside the whole home system if they’re concerned about specific contaminants like fluoride, which the whole home system won’t entirely remove.”

“We’ll conduct a quick test on your water, go over any concerns you may have, and walk you through both options. I’ll explain how the filters work, what they remove, and—if anything fits what you’re looking for—I’ll provide a quote, go over our 0% interest payment plans, and outline the next steps.”

Section Summary:

- Water pressure test
- Hand out brochures and ask probing questions
- Provide a clear outline of what the consultation will involve

Chlorine: 15–20 mins

“So we’re just going to start by running a quick chemical test on this sample I’ve just taken from your tap water.”

- Fill two cups — one with filtered water (brought by the technician), and one with tap water

“What we’re going to be testing first is the chlorine concentration in your water.”

What Is Chlorine?

Does the client know what chlorine is?

- Chemical commonly used in swimming pools
- Has a strong, distinct smell that radiates from large bodies of chlorinated water

Pools are known for having high levels of chlorine. What many people don’t realise is that tap water often contains just as much — if not more — chlorine than a swimming pool.

Why Is Chlorine Added?

- Chlorine is added because of where our drinking water comes from — it’s captured and stored in large, open dams, reservoirs, and catchments, which are full of dirt, bacteria, viruses, pollution, and more

- The government adds high levels of chlorine to kill bacteria and make the water 'safe' to drink

What they don't tell people is this: drinking this water today won't kill you tomorrow — but long-term exposure through drinking, showering, and inhalation can be harmful to your health.

Initial Test

"What I've got here is called a DPD1 tablet. You can get these from Bunnings or a pool shop. We'll actually give you a testing kit with your system, so you can check the water before, after, and periodically to ensure your system's efficiency."

- Drop the tablet into each cup
- Explain that the pink colour is a reaction to chlorine — the filtered water remains clear, which shows the filters have comprehensively removed the chemicals
- Show the customer the pool chart and explain that a healthy swimming pool typically falls between 1.0–1.5 on the colour chart (indicated by the pink shade)
- Explain that their water — the same water they drink, cook with, and bathe in — often has **1 to 3 times** the amount of chlorine found in a healthy swimming pool
- If they have a pool, test it and compare. If they don't, explain that you usually test pools as a benchmark

"Would you ever pour a cup of pool water and drink it? No. So why drink from the tap?"

"And what's the first thing most people do when they leave a pool? Shower the chemicals off."

Why Doesn't It Smell?

- So why doesn't tap water taste or smell as strong as pool water? The answer: **chloramine**
- Up to 20 different chemicals are added to municipal water, each one often offsetting the side effects of another
- In the case of chlorine, they add ammonia — this forms **chloramine** (5 parts chlorine, 1 part ammonia)
- The ammonia is used to mask the harsh taste and smell of chlorine

In no way does this improve the health effects of the water. In fact, it makes things worse.

Why Are We Showing This?

- These chemicals are linked to a variety of serious long-term health effects
-

What Are the Side Effects?

When chlorine reacts with organic matter, it forms disinfection by-products (DBPs) like **haloacetic acids (HAAs)** and **trihalomethanes (THMs)**

Long-term exposure has been linked to:

- Disruption of gut microbiome – weakens immunity, inflames the gut
- Increased cancer risk – including bladder, colon, rectal, liver, and kidney cancers
- Arterial hardening & cardiovascular stress – oxidative damage contributes to artery hardening and elevated strain
- Respiratory issues – inhaling chlorine vapours (e.g., in hot showers) can worsen asthma and allergies
- Neurotoxicity – linked to cognitive decline, hormonal imbalance, and developmental issues
- Reproductive issues – reduced fertility, increased miscarriage risk, and lower sperm quality
- Liver stress – altered liver enzymes and impaired detoxification

Does Boiling the Water Help?

- Boiling can evaporate chlorine over time — but it doesn't remove **disinfection by-products**
- In fact, boiling **concentrates** contaminants like heavy metals and fluoride, since the water evaporates but the toxins are left behind
- While boiling is great for killing bacteria, it's **not recommended** for chemically dense tap water

Is Bottled Water Better?

- No — bottled water is often worse
- A single-use plastic bottle can contain up to **250,000 micro and nano plastic particles**
- These are linked to hormonal disruption, inflammation, and gut issues
- Bottles exposed to heat during transport can leach **phthalates** and other endocrine-disrupting chemicals

“When we show people this test, many say: Thanks, that’s great — I’ll just buy bottled water or install a filter tap.”

Absorption Through Skin & Inhalation

There's no point drinking clean water if you're still showering in these chemicals.

- The skin is the largest organ in the body
- Studies show that during a 10-minute shower, you absorb **6–10x more chlorine** through your skin than from drinking 2 litres of tap water
- Hot water makes this worse, as it opens your pores and increases absorption

Worse still: **inhalation**

- Chlorine and its by-products become **gaseous** when heated
- This allows them to enter the bloodstream **directly** through the lungs — bypassing digestion
- This method of exposure is even more efficient and harmful than skin contact

So, if you only filter your drinking water, you're still exposed to about **6/7ths** of the chemicals — and drinking is the **least** harmful route.

Chlorine Test 2 — Fingers

Conduct skin absorption test

- Lighten the mood: jokingly ask for a volunteer
 - Ask them to place two fingers in a cup of chlorinated tap water for 2 minutes
 - Use a timer and explain the reason for the test
-

What Side Effects Does the Client Experience?

“While we wait for the test, I’d love to hear — is anyone in the house already experiencing any side effects from this water?”

- Aside from health concerns, chlorine is also a powerful bleaching agent
 - Ask questions:
 - **“Does anyone here get dry or itchy skin?”**
 - **“What about your hair — dryness, hair loss, or dandruff?”**
 - Showering daily in chlorinated water can slowly bleach skin and hair
 - Over time, this causes dryness, irritation, and hair fall
 - It can worsen conditions like **eczema**, which many clients get relief from after installing the system
 - Hair becomes frizzy, dull, and brittle
-

If the client appears to be from overseas, Ask from where:

“A lot of our customers come from overseas — places like India, the Middle East, or Asia. They often say they never had hair, skin, or gut issues back home, but after moving to Australia, they start noticing these problems.”

- Ask if these issues stop when they go back to their home country
- Ask if they ever considered the water as the cause
- People used to more natural water tend to react more strongly to our chemical-heavy supply

So, a **whole home system** isn't just about drinking water — it helps your **skin and hair** as well.

Encourage them to check your reviews: many customers rave about improvements in these areas after installation.

Chlorine Test 2 – Results

- After the 2-minute timer, conduct the second test
- Ask: **“Where do you think the chlorine went?”**
- It was absorbed **straight through the skin and into the bloodstream**
- In a hot shower, absorption happens **2–3x faster**, and the whole body is exposed — not just two fingers

Section Summary:

- What is chlorine?
- Why is chlorine added?
- Initial chlorine test
- Why doesn't it smell?
- Side effects of chlorine
- Does boiling help?
- Is bottled water better?
- Absorption & inhalation
- Chlorine skin test
- Symptoms the client may already have
- Test results and explanation

Filter Stage 1 – Coconut CTO (Chlorine, Taste & Odour) Cartridge: 2–5 mins

“So now we'll jump into the system and how it works. We have a 4-stage filtration system, with each stage designed to remove specific contaminants. The first stage is our Coconut Filter.”

- The Coconut Filter is made from coconut fibres that are charred and compressed down to **0.5 microns**
- For comparison: if you pluck a hair from your head, the hole it leaves is roughly **100 microns** wide
- This filter catches particles **200 times finer than a strand of hair** — and **5x finer** than most other systems on the market
- We use coconut because it's natural, highly absorbent, and effective
- It can remove **100% of chlorine** from your water for up to **12 months**
- Plus, it significantly improves the **taste and smell** of your water

Calcium / Water Softening Cartridge: 10 mins

Hard & Soft Water

Does the customer know the difference between hard and soft water?

- If you put a bucket outside and fill it with rainwater — that's soft, natural water
 - Water from the tap is what we call **hard water** because it contains hard metals and minerals that have dissolved through it
-

Kettle Check

“I’m going to check the hardness of your water by taking a look at the kettle.”

- Point out the yellow or black staining on the bottom
 - Explain this is caused by hard metals and minerals burning on over time
-

Calcium

The main culprit for issues with skin, hair, appliances, and cleaning is **calcium**

- Of course, we need calcium in our food and diet — but **in your water**, it's a different story
- The calcium in tap water is **synthetic** — added during treatment
- It isn't bioavailable, can bind to other minerals and inhibit absorption, and is terrible for appliances and cleaning
- It can contribute to kidney stones, leaves scale marks on glass and fixtures, and dries out hair and skin

“What our system does is soften your water — removing excess calcium that causes all these annoying issues.”

Soap

- Calcium interferes with soap's ability to lather and rinse off properly
- A common sign of high calcium is **difficulty washing off soap** — 90% comes off, but that last 10% feels like it just clings to your skin or hair
- With soft water, soap washes off easily
- You also don't need to use as much — instead of a 50-cent piece worth of shampoo/conditioner, you only need a **5c or 10c coin size**
- Why? Because calcium binds to soap suds **and your skin**, forming a thin film that makes the soap stick

Dryness of Skin & Hair

- That thin layer of calcium doesn't just make rinsing harder — it irritates skin and hair
- After showering, this layer stays on your body, drying out skin and hair
- This can cause rashes, itchiness, and accelerate hair fall
- By softening the water, you'll notice the difference right away — skin feels smoother, and soap rinses cleanly

Stains on Shower Screens and Glass

“Now, I can tell just by looking at your kettle that you're probably getting white stains on your shower screen.”

- Just like with skin, calcium sticks to surfaces
- This creates white marks on shower screens, caused by calcium binding with soap and clinging to the glass
- Our system reduces these stains by **up to 95%** — so you won't need to clean your bathroom nearly as often
- Normally, these stains come back in 1–2 weeks. With a system, it can take 2–3 months before they reappear
- The same goes for other surfaces like glass, taps, fixtures, and tables — they'll clean much easier
- Instead of water spots forming after you wipe down glass or windows, surfaces will stay spot-free and shiny

Appliances

“It's much better for your appliances too — dishwashers, washing machines, kettles, and hot water systems all run less efficiently and break down faster with hard tap water.”

- When a dishwasher breaks down, a technician often finds a thick build-up of calcium underneath
- That's because calcium dries and accumulates daily — leading to loss of efficiency and eventual damage
- With a filtration system, your appliances will:
 - Run more efficiently
 - Use less power
 - Last longer

Our business partners install thousands of hot water heat pumps, and they advise all customers to pair them with a whole home filtration system to extend the unit's lifespan.

Washing the Car

“Do you guys ever wash your car?”

- Filtered water is better for cleaning cars too
- When it dries, there are **no water spots** left behind — thanks to the removal of calcium and sediment
- Your car stays as shiny as it was while wet

Good car washes use large-scale filtration systems similar to ours — because the water quality makes a difference.

Clothes

“Do you guys hang your clothes outside or use a dryer?”

- Ever notice that towels or socks feel stiff or starchy after drying?
- Clothes lose softness and fluffiness in **calcium-rich** water
- The minerals get trapped in the fabric, and when dried, the clothes become stiff
- Plus, chlorine fades colours faster over time

With a filtration system, clothes stay soft, fluffy, and hold their colour longer

Wrap-Up

“We know the main reason you called us here is to remove contaminants from your water and improve your health. But I also wanted to show you some of the other benefits you might not have considered before.”

“All of these improvements we’ve just covered come from removing just the first two things — chlorine and calcium. Our system removes hundreds of contaminants, each with their own set of benefits.”

“Obviously, we don’t have time to go through every single one today — but you can see why so many people are now switching to filtered homes.”

Section Summary:

- Hard vs soft water explained
- Kettle check for visible scale
- Calcium and its downsides
- Effects on soap and skin
- Dryness of skin and hair
- Shower stains and cleaning ease
- Appliance longevity
- Car washing improvement
- Clothes softness and colour retention

The System, Replacement Cartridges & Installation: 5—10 mins

Installation

- The system is installed either on the wall of the home or next to the water meter
- It's integrated somewhere between the mains inlet and the internal water line
- Around **9 out of 10 customers** choose to have it installed next to the meter

→ Show picture of installed system [Visual: 3A]

Filter Replacements

The only ongoing maintenance is changing the filters roughly **once per year**.

There are **3 ways** to know when they're ready to be replaced:

1) After installation, the water will taste and smell noticeably better.

If chlorine taste or odour starts to return, it's a sign the filters are due for replacement.

We're the **only company** that includes a **chemical testing kit** with every system. Drop a tablet in the water every few months — if it turns **any shade of pink**, it's time to replace the filters.

2) If there's a **drop in water pressure**, the filters may be clogged and restricting flow.

At this point, you can open the system to check the condition of the cartridges.

3) We send **automated reminders** at 6, 9, and 12 months to help you stay on track — including how to check and when to change your filters.

→ Show video of old filter being replaced [Visual: 3B]

→ Show photo of old/new cartridge [Visual: 3C]

“Your filters start out brand new and white, like this.” *(Show image of clean cartridge)*

“And over time, after catching all the dirt, rust, and corrosion, they'll look like this.” *(Play video of brown, used filter being removed)*

“If you're not using a filter system, where do you think all that brown stuff ends up?”

- A full set of replacement filters (all 4 stages) is **\$300**

- So, the ongoing cost is approximately **\$300 per year**

DIY Filter Replacement: *(Takes ~5 mins once per year)*

→ **Reference image of system internals [Visual: 3D]**

1. Turn off water using the valves on either side
2. Use the special tool provided to unscrew the housings
3. Remove the old filters and dispose of them
4. Insert new filters into place
5. Tighten the housings and turn water back on — done!

When it's time to replace them, we can ship the filters **directly to your door**.

Referral Program

“Don’t worry too much about the ongoing cost — most of our customers actually get their filters for free!”

- We offer a **referral program** for all customers

Once your system is installed and you start noticing improvements — better-tasting water, softer skin, easier cleaning — you can **refer friends, family, or neighbours**

You’ll receive **a free set of replacement filters for every referral** that results in a sale. This can be claimed **unlimited times**

- So, the cost often takes care of itself
 - In fact, most customers refer **1, 2, or even 3+ people** in just the first few weeks
-

Section Summary:

- System installation overview → *[Visual: 3A]*
- Filter replacement steps and signs → *[Visual: 3B, 3D, 3C]*
- Referral program benefits and process

Heavy Metal Filter: 5–10 mins

Rusted Pipes

“I’ll quickly jump into the last and most important filter, explain how that works, and then we’ll be pretty much done. Have you guys ever seen what tap water pipes look like before?”

→ Show picture or video of a rusted pipe [Visual: 4A]

- The most important cartridge in our system is the **Heavy Metal Filter**
 - This filter removes some of the **most harmful and toxic contaminants**
 - The most notable of these is **lead**
-

Lead

“Do you know what lead is?”

- Lead is a **dangerous, cancer-causing heavy metal** — it’s toxic even in small amounts
-

Why Is Lead in Our Water?

- Australia has **outdated plumbing regulations**
- Until only a few years ago, pipes and tapware were manufactured using **up to 6% lead**
- As water flows through these materials, it picks up **trace amounts of metal** on the way to your tap
- While treatment removes contaminants **before distribution**, **lead picked up afterward** — in your plumbing or aging water mains — cannot be removed
- Even with updated regulations, **most Australians still consume trace levels of lead daily**, regardless of where they live

Study Insight:

Macquarie University found that **11 out of 12 homes in Australia** had **detectable traces of lead** in their water.

But What About New Suburbs with Plastic Pipes?

- Even if your home is brand new and uses plastic pipes — **you’re still not safe**
 - Water travels **through older suburbs** with ageing infrastructure before reaching newer areas
 - That means even homes with modern plumbing can be exposed to metals and rust **picked up earlier in the journey**
-

Why Is This a Problem, Even in Small Amounts?

- The issue with **heavy metals** like lead is they **don’t leave your body easily**
- They enter your bloodstream and accumulate in your **organs and tissues**
- Detoxing can take **years**, even **decades**

So over time, your body accumulates toxic contaminants — and even mild exposure can have serious long-term effects.

Lead Exposure — Side Effects in Adults:

- **High Blood Pressure & Heart Disease**
Increases risk of stroke, heart attack, and other cardiovascular issues
 - **Memory Loss, Dementia, Alzheimer's Risk**
Long-term cognitive decline and increased risk of neurodegenerative disease
 - **Chronic Fatigue**
Lead disrupts cellular energy, causing persistent tiredness
 - **Mood Disorders**
Can contribute to anxiety, irritability, and depression
 - **Muscle & Joint Pain**
Builds up in bones and tissues, leading to stiffness and pain
 - **Kidney Damage**
Long-term exposure impairs kidney function
 - **Reproductive Issues**
Linked to lower fertility, miscarriage, and pregnancy complications
 - **Weakened Immune System**
Makes the body more vulnerable to infections and slower to heal
-

Lead Exposure — Side Effects in Children

“Are you aware that diagnoses of conditions like autism and ADHD in Australian children have skyrocketed in recent decades — and continue to rise every year?”

- Many researchers believe **lead in drinking water** may be a **root contributor**
- Early lead exposure has been linked to a number of serious developmental issues

Key Effects in Children:

- Lower IQ
- Learning difficulties
- Higher risk of ADHD and autism-like symptoms
- Speech and language delays
- Behavioural issues (e.g. hyperactivity, aggression)
- Slowed physical growth
- Hearing problems
- Weakened immunity
- Increased risk of health problems later in life

A Macquarie University scientist was even featured on Channel 9 News raising awareness about this national issue.

Why PureFlow Has the Best Heavy Metal Filter

Most companies don't prioritise heavy metal removal — but we do.

- Our filter captures down to **0.5 microns**
 - Competitors often only go down to 1, 5, or 10 microns
 - This makes ours **up to 20x more precise**
 - We **manufacture in Thailand**, using premium **coconut carbon** and **superior filtration technology**
 - Many companies use cheap Chinese filters or skip this step altogether
 - We're one of the **only brands** investing heavily in this space
 - Our cartridge uses **ATS ceramic media**, which performs **ion exchange** to specifically target and **remove lead, mercury, arsenic**, and more — without releasing harmful byproducts
 - We prioritise **health over profit** — even if the benefits aren't as “visible” as chlorine removal
 - Our filters remove **up to 98% of lead**, whereas many others only achieve **20–50%**
-

Section Summary:

- Rusted pipes → *[Visual: 4A]*
- What lead is and why it matters
- Why lead is in our water
- Side effects of lead exposure
- Long-term effects on children
- Why PureFlow's heavy metal filter is market-leading

Whole Home Filter Conclusion: 1 min

- Essentially, our whole home filtration system will **remove nearly all of the contaminants** that should be of concern to you
- It provides the **entire family with high-quality filtered water** from **every tap, shower, and appliance** in your home
- **Heavy metals, chlorine, calcium**, and much more are effectively eliminated from your water supply

Fluoride: 5 mins

- The main chemical that people are still concerned about — and that **doesn't get fully removed** by the whole home filter — is **fluoride**
- Fluoride is a **very controversial topic** — some people are all for it, others are strongly against it

Ask: Does the customer know what fluoride is? Is it something they're concerned about?

What is Fluoride?

- Fluoride is a **toxic chemical** added to our tap water to **help protect dental health**
- It's also found in toothpaste — and that's why there's a **poison warning on the label**, advising not to swallow it
- If someone doesn't brush or take care of their teeth, fluoride can coat the enamel and **slow the decay process**

But here's the issue:

- If you **do brush your teeth** and maintain good dental hygiene, you don't need fluoride
 - In fact, **excessive fluoride can do more harm than good**
-

Risks of Overexposure

- Fluoride affects **more than just your teeth** — it impacts your **bones, joints, thyroid, and brain**
- In Australia, fluoride levels in the water are high enough that anyone drinking adequate daily water is likely getting **too much**

Over time, this can lead to a condition called **fluorosis**

“Have you ever seen someone with white or yellow spots on their teeth or nails? That's an early sign of fluorosis.”

- Fluorosis isn't just cosmetic — it's also a sign that fluoride is **accumulating in bones and joints**, potentially leading to **joint pain and arthritis** later in life
 - Fluoride is also a **thyroid suppressant** and is classified as a **neurotoxin**
-

Fluoride and Brain Development

- Multiple studies have linked fluoride to **reduced IQ in children**
 - A **meta-analysis of 56 studies** in the U.S. found that **53 out of 56** showed a **significant link** between fluoride exposure and lowered IQ scores
-

How Do You Remove It?

- Fluoride is **extremely difficult to remove** due to its microscopic size
- While the whole home system may **reduce** fluoride slightly, to **completely remove it**, we recommend pairing it with our **reverse osmosis (RO) system**

Reverse Osmosis System (Add-On): 5–10 mins

What Is Reverse Osmosis (RO)?

“The RO is a separate system we can install underneath your sink as an add-on to the whole home filtration.”

Ask: Has the customer heard of Reverse Osmosis (RO) before?

- This system is strictly for **drinking and cooking**
- Comes with its own small filter tap, or we can replace your existing tap with a compatible one
- RO isn't essential for everyone — but for those concerned about **fluoride, pharmaceuticals, or maximum purity**, we recommend it for their drinking water

Unlike the whole home system, which **filters as water flows**, RO **washes the water** at a microscopic level:

- For every **1 litre of pure water** produced, **2 litres** are used
- It draws in 2 litres, flushes 1 litre of “dirty water” (including fluoride and any residual contaminants), and provides **1 litre of 99.999% pure water**
- Because it's only for drinking, water usage remains minimal. If you drink 5L/day, only 5L is “wasted”
- Filters down to **0.0001 microns** — that's **700,000 times smaller than a strand of hair**

Why Choose Our RO System?

- **Industry-leading accuracy** — 0.0001 micron filtration
- **Stainless steel storage tank** — no plastic like cheaper systems
- **USA-made RO membrane** — premium quality
- **High pH alkaline water** — sits at a smooth pH of 9.5
- **Tested and certified** for Melbourne water conditions

Alkaline Water

The only downside to RO is that it **removes everything** — including **beneficial minerals and electrolytes**

To solve this, our system includes a **remineralisation stage** that adds calcium, magnesium, and other minerals back into the water

This raises the **pH to 9.5**, creating **alkaline water** — known among health professionals as one of the healthiest forms of drinking water

with alkaline water?

- Bottled alkaline water can cost **\$5 or more per bottle**
 - With this system, you get **unlimited alkaline water on tap** at home — free from contaminants and full of essential minerals
-

Alkaline Water Benefits

Some of the key benefits of alkaline water include:

- **Reduces acid reflux** — helps neutralise excess stomach acid
 - **Improves hydration** — better cellular absorption
 - **Supports detox** — assists in flushing out acidic waste
 - **Boosts energy** — many report reduced fatigue
 - **Aids digestion** — supports smoother gut function
 - **May support bone health** — reduces calcium loss from bones to balance pH
-

Who Adds the RO System?

Most customers see the **whole home filtration** as an absolute necessity — after all, there's no point drinking clean water if your skin and lungs are still absorbing chemicals.

However, many also choose to **add the RO system** for:

- **Fluoride-free drinking water**
 - **High-quality alkaline water**
 - **Relief from acid reflux or heartburn**
 - **The most advanced 0.0001 micron filtration for their drinking water**
-

Section Summary:

- What is reverse osmosis?
- Why PureFlow RO?

Warranties & Benefits of PureFlow: 5 mins

System Durability & Filter Safety

“When investing in your home and health with a product like this, you want to ensure it’s a one-time purchase that lasts as long as the house does.”

- All PureFlow systems are **designed and assembled right here in Australia** — built specifically for **Australian water conditions**
- Most competitors buy **cheap overseas systems**, slap a sticker on them, and market them as "made for Australia"
- That’s risky — our water contains more contaminants and **unique chemical compounds** not found in other parts of the world
- Many filters on the market aren’t designed for our water and may not perform properly
- Some companies use **low-grade plastic cartridges** — when strong chemicals pass through them, the plastics can break down and **leach microplastics or chemical by-products** back into your water

At PureFlow, we use:

- **Certified, non-leaching natural filters**
- **Inert materials** like coconut carbon — tested specifically for Australian water
- Filters that go through **rigorous certification**, often taking **up to 18 months** before coming to market

In-House Installation Team

PureFlow also has our **own local installation team** — no outsourcing.

- This matters because it ensures your **warranty and workmanship are fully covered**
- Other companies often chase the cheapest local plumber available, many of whom **have never worked with the system before**
- It might work fine at first — but if a leak shows up 6 months later, what happens?

You call the filter company — they blame the plumber.

You call the plumber — they blame the product.

You’re stuck in the middle — **no coverage, no warranty, no help.**

- When companies use third-party contractors, it gives them an **easy escape from warranty responsibility**
- PureFlow is a **Melbourne-based business** with a **Melbourne-based install team**
- If anything ever happens — **we’re just around the corner**

Warranties & Guarantee

To back all of this up:

- We offer a **7-year workmanship warranty**, covering all pipework, valves, and components handled during installation
- If you ever have an issue, **we’ll be there within a day**

We also offer a **30-day money-back guarantee**:

- We're the **only company** that includes a **free chemical testing kit** with your system
 - Test the water before and after — if it shows **any colour other than clear** (even light pink), we'll refund you. No questions asked
 - That said, **no one has ever claimed it** — our systems work, and **100% of our customers love them**. But the guarantee is there for peace of mind
-

System Portability

- PureFlow systems are **100% relocatable** — take yours with you when you move
 - These units are designed to **last a lifetime**, and we want this to be a **one-time purchase**
 - Whether you move in 5, 10, 15, or 20 years — **just bring the system along**
 - Our casings are made from **thick stainless steel**, built for Australia's **harsh weather conditions**
 - As long as nothing damages the outer shell, your system will **last a lifetime**
-

Section Summary:

- System durability & filter safety
- In-house installation team
- Warranties & guarantees

Why Choose a PureFlow System? — 5 mins

Our systems are **designed and assembled specifically for Australian water**. We deliver **industry-leading performance**, use the **best filters and materials** available, and are a **local Melbourne company** with **hundreds of 5-star reviews** online. We've got a **perfect rating** and have **never had an unhappy customer**.

But it's not just the product — it's the **service**. We pride ourselves even more on our **customer support and after-sales care**. We're always just a phone call away and never disappear after the job's done — unlike many companies today.

Here's what sets our product and service apart:

Industry-Leading Filter Accuracy

- Our **whole home system filters down to 0.5 microns** (200x finer than a strand of hair)
→ Most competitors only go down to 10, 5, or maybe 1 micron

- Our **RO system filters down to 0.0001 microns** — the finest in the country (700,000x finer than a strand of hair)
→ Most other RO systems only filter down to 0.0005 microns
-

Stainless Steel Products

- Built to last. Our whole home system comes in a **100% stainless steel housing**
 - It's also coated in a **UV-protective layer**, making it the **most durable system** on the market
 - Competitors often use **plastic, cheap metals, or powder coating** to brand their systems
 - Our **RO system uses a stainless steel storage tank**, while most others use plastic — which defeats the purpose of removing microplastics
-

Local Melbourne Company with Local Installers

- Installed by **local plumbing experts** who work with our system every day
 - Always on call if you need assistance
 - Other companies are **interstate** or use random **cheap contractors**, making it hard to get help when something goes wrong
 - We operate from **factories in Mornington, Altona, and soon the northern suburbs of Melbourne**
-

4-Stage Filtration for the Whole Home

- Our 4-stage system is designed to **target the widest variety of contaminants**
 - It uses **efficient 2-in-1 coconut filters** to save space and deliver premium water quality throughout the home
 - Most other brands use only 2–3 stages, lower-grade carbon, and often **don't remove heavy metals like lead**
-

Global Best-in-Class Components

- We handpick parts and components from the **world's best suppliers**
 - Manufactured across **Taiwan, Thailand, Italy, the USA, China, and more**
 - Other companies typically manufacture everything in one place (usually China), cutting cost but also quality
-

Best-in-Class Lead Removal (Whole Home)

- Our system removes **up to 98% of lead** — far beyond what others can offer
- Most systems remove very little, if any, lead at all

Largest Filter Cartridges in the Industry

- We use **large 20” cartridges** for longer life and better water pressure
- Other systems use **10” or 15” cartridges**, which need replacing twice as often and reduce pressure

Free Testing Kit with Your System

- We include a **free testing kit**, so you can verify the system is doing its job
- If the result isn't clear water — **you get your money back, no questions asked**
- Most companies don't provide any way to test and offer **no peace of mind**

Section Summary:

- Designed and assembled for **Australian water conditions**
- **Industry-leading filtration** accuracy — up to **0.0001 microns**
- Built with **durable stainless steel** housings and tanks
- Backed by a **local Melbourne-based company** with local installers
- **4-stage whole home filtration** targeting a wide range of contaminants
- Components sourced from the **best global manufacturers**
- **Superior lead removal** — up to 98%
- **Largest filters** in the industry for better pressure and longer life
- Includes a **free chemical testing kit** for peace of mind
- Backed by **hundreds of 5-star reviews** and unbeatable after-sales support

Pricing: 5–10 mins

“So out of both systems — the whole home system or the full package with both — which one was resonating with you guys more?”

“Awesome. I'll run you through pricing on both packages so we can work out what suits you best.”

“You're actually getting in at a really good time — you might've seen our text. We're currently running a 20% promotion for customers who book a water test.”

“We also have two payment options: if you'd prefer not to pay the system off upfront, you can take advantage of our 0% interest finance option as well.”

Whole Home System Only

“We’ll start with the pricing for the whole home system on its own, then I’ll break down the full package.”

“We have two price points: First is our recommended retail price. This applies if you decide to call us back tomorrow, next week, or order over the phone or online — in those cases, you’d be charged the RRP.”

“As discussed, though, we’ve got a 20% off promotion running right now — but it’s strictly for appointments like this. If you’re ready to go ahead today, we can give you the best possible price. If not, no stress — you can still purchase at retail pricing, but unfortunately we can’t hold the discounted rate outside this appointment.”

- RRP: \$5,195 — this includes installation, full warranty, your first set of filters, and no hidden costs
- With the promo: \$1,000 discount, bringing it down to \$4,195 fully installed

“Now, although \$1,000 off is great, we get that not everyone has that kind of money sitting in the bank ready to go.”

“That’s why most of our customers don’t pay the full amount upfront. Instead, they just pay \$450, get the system installed right away, and start enjoying the health benefits immediately.”

“Two weeks later — once they’ve tested the system and are stoked — they pop the remainder onto a 0% interest payment plan, paying it off over up to 30 months.”

- \$58.54 per fortnight
- That’s just \$29/week to support your family’s long-term health and wellbeing

Full Package (Whole Home + RO)

“If you were thinking of going with the full package, here’s how the pricing would look:”

- Whole Home System: still \$4,195 with your \$1,000 discount
- RO System RRP: \$1,595
- Today’s Price for RO: \$1,295 (includes a \$300 discount, fully installed)

“That brings the full package retail to \$6,785 — but with today’s total discount of \$1,300, you’re looking at just \$5,485 fully installed.”

“Again, most customers choose to just pay us \$600, get both systems installed right away, and pop the rest on the interest-free plan 2 weeks later.”

- \$76.08 per fortnight for both systems
- That’s just \$38/week for your family to have the cleanest water possible, from every tap — plus the highest-quality drinking water
